Sample Anatomy and Physiology MCQs with Answers and Explanations

Example 1: Basic Structural Knowledge

Question:

Which layer of the heart wall is responsible for the contractile function of the heart?

- a) Epicardium
- b) Myocardium
- c) Endocardium
- d) Pericardium

Answer:

- b) Myocardium

Explanation:

The myocardium is the thick, muscular middle layer of the heart wall composed of cardiac muscle fibers. It is responsible for the heart's contractile function, enabling blood to be pumped throughout the body. The epicardium is the outer layer, providing protection; the endocardium lines the interior chambers, and the pericardium is a protective sac surrounding the heart.

Example 2: Physiology of the Circulatory System

Question:

What is the primary function of red blood cells?

- a) Fight infections
- b) Transport oxygen
- c) Clot blood
- d) Regulate blood pressure

Answer:

- b) Transport oxygen

Explanation:

Red blood cells (erythrocytes) contain hemoglobin, a protein that binds oxygen in the lungs and releases it in tissues. While they also play a minor role in carbon dioxide transport, their main function is oxygen delivery, making option b correct.

Example 3: Respiratory System

Question:

Where does gas exchange primarily occur in the respiratory system?

- a) Trachea
- b) Bronchi
- c) Alveoli
- d) Larynx

Answer:

- c) Alveoli

Explanation:

Alveoli are tiny, balloon-like structures at the end of the bronchioles within the lungs. They provide a

large surface area for gas exchange? oxygen diffuses into the blood, and carbon dioxide diffuses out. The trachea and bronchi serve as air passages, but the actual gas exchange occurs in alveoli.

Example 4: Nervous System

Question:

Which part of the nervous system is responsible for voluntary control of skeletal muscles?

- a) Sympathetic nervous system
- b) Parasympathetic nervous system
- c) Somatic nervous system
- d) Autonomic nervous system

Answer:

- c) Somatic nervous system

Explanation:

The somatic nervous system controls voluntary movements by transmitting signals from the central nervous system to skeletal muscles. The autonomic nervous system, which includes sympathetic and parasympathetic divisions, controls involuntary functions such as heart rate and digestion.

Example 5: Endocrine System

Question:

Which gland is primarily responsible for regulating metabolism?

- a) Pituitary gland
- b) Thyroid gland
- c) Adrenal gland
- d) Pancreas

Answer:

b) Thyroid gland

Explanation:

The thyroid gland produces hormones like thyroxine (T4) and triiodothyronine (T3), which regulate the body's metabolic rate. The pituitary gland controls many endocrine functions but is not directly responsible for metabolism regulation.
