QuestionAnswer What is data communication and its main components? Data communication refers to the exchange of data between devices through a transmission medium. Its main components include the message, sender, receiver, transmission medium, and protocols. Explain the difference between serial and parallel data transmission. Serial transmission sends data bits one after another over a single channel, suitable for long distances. Parallel transmission sends multiple

bits simultaneously over multiple channels, ideal for short distances due to higher speed but increased complexity. What are the common types of transmission media used in data communication? Common transmission media include guided media like twisted pair cables, coaxial cables, fiber optic cables, and unguided media such as radio waves, microwaves, and infrared signals. Define bandwidth and its significance in data communication. Bandwidth refers to the maximum rate of data transfer over a communication channel, usually measured in bits per second. Protocols are sets of rules that govern data exchange between devices, ensuring correct, reliable, and secure communication by defining procedures for data formatting, transmission, error checking, and acknowledgment. Differentiate between analog and digital data transmission. Analog transmission involves continuous signals and is susceptible to noise, while digital transmission involves discrete signals, offering better noise immunity and error correction capabilities. What is modulation in data communication, and why is it necessary? Modulation is the process of encoding digital data onto analog carrier signals for transmission. It is necessary to enable data transfer over long distances and through various media where digital signals cannot travel directly. Explain the concept of error detection and correction in data communication. Error detection involves identifying errors in transmitted data using techniques like parity checks or CRC, while error correction involves methods to automatically fix errors, ensuring data integrity during transmission.
