In Trueman's Class 11 Biology, the main components of the cell include the nucleus, cytoplasm, cell membrane, mitochondria, endoplasmic reticulum, Golgi apparatus, and the cell wall in plant cells. How does the structure of a plant cell differ from that of an animal cell? Plant cells have a cell wall, chloroplasts, and a large central vacuole, which are absent in animal cells. Animal cells lack cell walls and chloroplasts and typically have smaller vacuoles. What is the significance of the cell membrane in biological processes? The cell membrane controls the entry and exit of substances, maintains homeostasis, and facilitates communication between cells, making it vital for cellular function and survival. Can you explain the process of osmosis as discussed in Trueman's Biology Class 11? Osmosis is the movement of water molecules from a region of lower solute concentration to a region of higher solute concentration across a semi-permeable membrane, helping maintain cell turgidity. What are the functions of mitochondria in the cell? Mitochondria are known as the powerhouses of the cell because they generate ATP through cellular respiration, providing energy for various cellular activities. How are prokaryotic and eukaryotic cells different according to Class 11 Biology? Prokaryotic cells lack a true nucleus and membrane-bound organelles, whereas eukaryotic cells have a defined nucleus and possess membrane-bound organelles, making them more complex. What is the role of the Golgi apparatus in the cell? The Golgi apparatus modifies, sorts, and packages proteins and lipids for secretion or delivery to other parts of the cell, playing a key role in cellular transport and processing.
